# Chapter 1. Introduction

This document describes the integration of the NetApp ONTAP data management software with the Entrust KeyControl key management solution using the open standard KMIP protocol. KeyControl serves as a key manager for encryption keys by using various protocols, including KMIP.

## 1.1. Product configuration

Entrust has successfully tested the integration of KeyControl with NetApp ONTAP in the following configurations:

Product	Version
NetApp ONTAP	9.8P3, 9.9.1, 9.10.1, 9.12.1, 9.14.1
Entrust KeyControl	5.3, 5.4, 5.5.1, 10.0, 10.1, 10.1.1, 10.2

## 1.2. Requirements

Before starting the integration process, familiarize yourself with:

- [NetApp ONTAP 9 Online Documentation](#).
- [Entrust KeyControl Online Documentation Set](#).

## Chapter 2. Deploy Entrust KeyControl

The following steps summarize the deployment of the Entrust KeyControl:

1. [Deploy a Entrust KeyControl cluster](#)
2. [Create a KMIP Vault in Entrust KeyControl](#)
3. [Create the Entrust KeyControl client certificate bundle](#)

### 2.1. Deploy a Entrust KeyControl cluster

For the purpose of this integration, a two-node cluster was deployed.

1. Download the Entrust KeyControl software from [Entrust TrustedCare](#). This software is available both as an OVA or ISO image. The OVA installation method in VMware is used in this deployment.
2. Install Entrust KeyControl as described in [Entrust KeyControl OVA Installation](#).
3. Configure the first Entrust KeyControl node as described in [Configuring the First Entrust KeyControl Node \(OVA Install\)](#).
4. Add second Entrust KeyControl node to cluster as described in [Adding a New Entrust KeyControl Node to an Existing Cluster \(OVA Install\)](#).

Both nodes need access to an NTP server. Sign in to the console to change the default NTP server if required.

Node	Status	Server Name	IP Address
Current Node	Online	★ kcv-10-2-node-1.interop.local	
	Online	kcv-10-2-node-2.interop.local	

5. Install the Entrust KeyControl license as described in [Managing the Entrust KeyControl License](#).
6. Add a record in your DNS server for the Entrust KeyControl cluster. Associate all KeyControl Cluster node IPs to the one record.
7. Install a signed certificate from your local root CA. See [Appendix A - Install a signed certificate from your local root CA in the Entrust KeyControl cluster](#)

### 2.2. Create a KMIP Vault in Entrust KeyControl

---

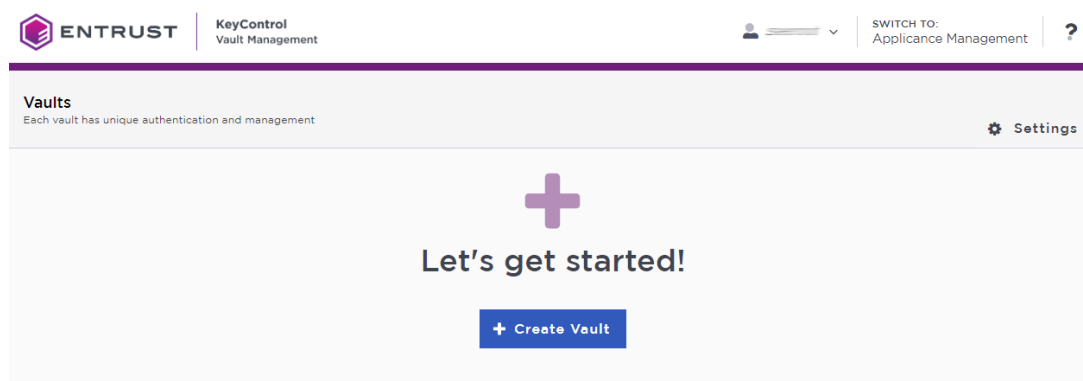

The Entrust KeyControl Vault appliance supports different type of vaults that can be used by all type of applications. This section describes how to create a KMIP Vault in the Entrust KeyControl Vault Server.

Refer to the [Creating a Vault](#) section of the admin guide for more details.

1. Sign in to the Entrust KeyControl Vault Server web user interface:
  - a. Use your browser to access the IP address of the server.
  - b. Sign in using the **secretroot** credentials.
2. From the user's dropdown menu, select **Vault Management**.

3. In the Entrust KeyControl Vault Management interface, select **Create Vault**.

Entrust KeyControl Vault supports the following types of vaults:

- **Cloud Key Management** - Vault for cloud keys such as BYOK and HYOK.
- **KMIP** - Vault for KMIP Objects.
- **PASM** - Vault for objects such as passwords, files, SSH keys, and so on.
- **Database** - Vault for database keys.
- **Tokenization** - Vault for tokenization policies.
- **VM Encryption** - Vault for encrypting VMs.

4. In the **Create Vault** page, create a **KMIP** Vault:

Field	Value
Type	KMIP
Name	Vault name
Description	Vault description
Admin Name	Vault administrator username
Admin Email	Vault administrator email

For example:

**Create Vault**  
A vault will have unique authentication and management.

**Type**  
Choose the type of vault to create

KMIP

**Name \***

NetApp-ONTAP

**Description**

NetApp-ONTAP integration with Entrust KeyControl

Max. 300 characters

---

**Administration**  
Invite an individual to have complete access and control over this vault. They will be responsible for inviting additional members.

**Admin Name \***

**Admin Email \***

**Create Vault** **Cancel**

5. Select **Create Vault**. Then select **Close**.

---

## ✔ Vault Successfully Created

The Administrator will be sent an email with a unique URL and temporary password to log in to their site. This URL will be in the Vault details for future reference.

### Vault URL

[Redacted]

 Copy

### User Name

[Redacted]

 Copy

### Temporary Password

[Redacted]

 Copy

Close

The new vault's URL and sign-in credentials will be emailed to the administrator's email address entered above. In closed gap environments where email is not available, the URL and sign-in credentials are displayed at this time.

Example email:

**Administrator, you have been invited to become an administrator of the KMIP vault, CommVault.**

To sign in, use the following:

URL: [Redacted]  
User Name: [Redacted]  
Password: [Redacted]

If you have any issues, [contact support](#).

©2023 Entrust Corporation. All Rights Reserved

6. Bookmark the URL.
7. The newly created Vault is added to the **Vault Management** dashboard.

For example:

8. Sign in to the URL provided above with the temporary password. Change the initial password when prompted. Sign in again to verify.

For example:

## KeyControl Vault for KMIP

Sign in to your account

User Name

Password

SIGN IN

9. Notice the new vault.

For example:

## 2.3. Create the Entrust KeyControl client certificate bundle

Certificates are required to facilitate the KMIP communications from the Entrust KeyControl KMIP Vault and NetApp ONTAP application and conversely. The built-in capabilities in Entrust KeyControl are used to create and publish the certificate.

1. Login to the KMIP Vault with the URL and credentials from [Create a KMIP](#)

### Vault in Entrust KeyControl.

2. Select **Security**, then **Client Certificates**.

3. In the **Manage Client Certificate** page, select the **+** icon on the right to create a new certificate. The **Create Client Certificate** dialog box appears.
4. In the **Create Client Certificate** dialog box:
  - a. Enter the username.
  - b. Enter the expiration date.
  - c. Leave **Certificate Signing Request (CSR)** field as default.
  - d. Select **Create**.

For example:

**Create Client Certificate** ✕

Add Authentication for Certificate

**Certificate Name \***  
entrust-keycontrol

**Certificate Expiration \***  
Apr 12, 2025 📅

**Certificate Signing Request (CSR)**  
Choose a file to upload Browse

Encrypt Certificate Bundle

Cancel Create

The new certificates are added to the **Manage Client Certificate** pane.

5. Select the certificate and select the **Download** icon to download the certificate.

6. Unzip the downloaded file. It contains the following:

- A `certname.pem` file that includes both the client certificate and private key. In this example, this file is called `entrust-keycontrol.pem`.

The client certificate section of the `certname.pem` file includes the lines “-----BEGIN CERTIFICATE-----” and “-----END CERTIFICATE-----” and all text between them.

The private key section of the `certname.pem` file includes the lines “-----BEGIN PRIVATE KEY-----” and “-----END PRIVATE KEY-----” and all text in between them.

- A `cacert.pem` file which is the root certificate for the KMS cluster. It is always named `cacert.pem`.

## Chapter 3. Deploy NetApp Simulate ONTAP

This integration testing was performed using Simulate ONTAP configured as a single node. Simulate ONTAP 9.x is a virtual simulator for ONTAP® software. The virtual simulator was deployed as a virtual machine in VMware.

1. Download the simulator ova file from [Simulate ONTAP Download](#)
2. Deploy the virtual machine. For the purpose on this integration, the **STORAGE SYSTEM NAME** is set to **mycluster**.
3. Add a record in your DNS server for the **Cluster Management**.
4. Configure the NTP server per NetApp documentation.
5. Install the root CA certificate from your root CA.

For example:

```
mycluster::> security certificate install -vserver mycluster -type server-ca -subtype kmip-cert
```

...

You should keep a copy of the CA-signed digital certificate for future reference.

The installed certificate's CA and serial number for reference:

CA: interop-CONTROLLER-CA-4

serial: 3DAC5A62645AD5AB4E569666B3E4DA66

The certificate's generated name for reference: interop-CONTROLLER-CA-4

Note the certificate's generated name above, e.g. **interop-CONTROLLER-CA-4**. It will be needed in section [Setup Entrust KeyControl as the external KMIP server](#).

# Chapter 4. Integrate Entrust KeyControl with NetApp ONTAP

The following steps summarize the integration of Entrust KeyControl with NetApp ONTAP.

- [Install the Entrust KeyControl client bundle into NetApp ONTAP](#)
- [Setup Entrust KeyControl as the external KMIP server](#)

## 4.1. Install the Entrust KeyControl client bundle into NetApp ONTAP

1. Open a command window and remote login into the NetApp ONTAP Cluster Management.

```
>ssh admin@xxx.xxx.xxx.xxx
Password:

Last login time: 4/11/2024 19:44:22
mycluster::>
```

2. Run the following command. Paste the certificate section from the `entrust-keycontrol.pem` file from section [Create the Entrust KeyControl client certificate bundle](#) when prompted. Paste the private key section when prompted.

```
mycluster::> security certificate install -server mycluster -type client -subtype kmip-cert

Please enter Certificate: Press <Enter> when done

-----END PRIVATE KEY-----

Enter certificates of certification authorities (CA) which form the certificate chain of the client certificate. This starts with the issuing CA certificate of the client certificate and can range up to the root CA certificate.

Do you want to continue entering root and/or intermediate certificates {y|n}: n

You should keep a copy of the private key and the CA-signed digital certificate for future reference.

The installed certificate's CA and serial number for reference:

CA: HyTrust KeyControl Certificate Authority  
serial: D79D9487

The certificate's generated name for reference: `entrust-keycontrol_D79D9487`

3. Note the certificate's generated name above, e.g. **entrust-keycontrol\_D79D9487**. It will be needed in section [Setup Entrust KeyControl as the external KMIP server](#).

## 4.2. Setup Entrust KeyControl as the external KMIP server

1. Open a command window and remote login into the NetApp ONTAP Cluster Management.
2. Enable the external KMIP server. The argument of **-client-cert** is the certificate's generated name from section [Install the Entrust KeyControl client bundle into NetApp ONTAP](#). The argument of **-server-ca-certs** is the certificate's generated name from section [Deploy NetApp Simulate ONTAP](#).

Notice the IP of both nodes in the Entrust KeyControl cluster.

```
mycluster::> security key-manager external enable -key-servers 10.194.148.215:5696,10.194.148.216:5696  
-client-cert entrust-keycontrol_D79D9487 -server-ca-certs interop-CONTROLLER-CA-4
```

3. Verify the external key-management is configured.

```
mycluster::> security key-manager external show-status
```

Node	Vserver	Primary Key Server	Status
mycluster-01	mycluster	10.194.148.215:5696	available
		10.194.148.216:5696	available

2 entries were displayed.

## Chapter 5. Test integration

This test procedure requires test scripts available from NetApp. The output files resulting from executing the test scripts need to be sent back to NetApp for verification.

1. [Load the test scripts into NetApp ONTAP](#)
2. [Execute the kmip\\_before\\_reboot\\_test.sh test script](#)
3. [Execute the kmip\\_post\\_reboot\\_test.sh test script](#)
4. [Enable FIPS mode](#)
5. [Execute the before and post test scripts a second time](#)
6. [Verify FIPS mode is unchanged after reboot](#)

### 5.1. Load the test scripts into NetApp ONTAP

1. Open a command window and remote login into the NetApp ONTAP Cluster Management.
2. Set diagnostics.

```
mycluster::> set diag

Warning: These diagnostic commands are for use by NetApp personnel only.
Do you want to continue? {y|n}: y

mycluster::~*>
```

3. Enter system shell. Provide the password when prompted.

```
mycluster::~*> systemshell -node mycluster-01
(system node systemshell)
diag@127.0.0.1's password:

Warning: The system shell provides access to low-level
diagnostic tools that can cause irreparable damage to
the system if not used properly. Use this environment
only when directed to do so by support personnel.

mycluster-01%
```

4. scp the test script files from a server of your choice into the Systemshell of the NetApp ONTAP node. Provide the password when prompted.

```
mycluster-01% scp root@10.194.148.52:/root/Downloads/kmip_before_reboot_test.sh kmip_before_reboot_test.sh
root@10.194.148.52's password:
kmip_before_reboot_test.sh                               100% 7346   731.0KB/s
00:00
```

```
SSH terminating : scp.c : main : 690,errs = 0.
```

```
mycluster-01% scp root@10.194.148.52:/root/Downloads/kmip_post_reboot_test.sh kmip_post_reboot_test.sh
root@10.194.148.52's password:
kmip_post_reboot_test.sh                               100% 6047    3.6MB/s
00:00
SSH terminating : scp.c : main : 690,errs = 0.
```

5. Verify the test scripts files are in the current directory.

```
mycluster-01% ls
kmip_before_reboot_test.sh  kmip_post_reboot_test.sh
```

## 5.2. Execute the `kmip_before_reboot_test.sh` test script

1. Open a command window and remote login into the NetApp ONTAP Cluster Management.
2. Set diagnostics.

```
mycluster::> set diag

Warning: These diagnostic commands are for use by NetApp personnel only.
Do you want to continue? {y|n}: y

mycluster::~*>
```

3. Enter Systemshell. Provide the password when prompted.

```
mycluster::~*> systemshell -node mycluster-01
(system node systemshell)
diag@127.0.0.1's password:

Warning: The system shell provides access to low-level
diagnostic tools that can cause irreparable damage to
the system if not used properly. Use this environment
only when directed to do so by support personnel.

mycluster-01%
```

4. Execute the `kmip_before_reboot_test.sh` test script and redirect the output to file `before_reboot_output_1.txt`. KeyControl presents itself as a single entity even though it may be composed of multiple nodes (two in this test case). Therefore, select **no** in the **Please enter whether this is a clustered key-server config (yes or no):** question below.

```
mycluster-01% bash kmip_before_reboot_test.sh > before_reboot_output_1.txt
Please enter key server name: KeyControl
Please enter key server version: 10.2
```

```
Please enter whether this is a clustered key-server config (yes or no): no
Sleeping for 10 seconds before checking if aggregate was created...
Sleeping for 10 seconds before checking if vserver was created...
```

## 5. Exit Systemshell.

```
mycluster-01% exit
```

## 6. Reboot the node. Wait 10 minutes before logging back into the cluster.

```
mycluster::*> reboot -node mycluster-01
(system node reboot)

Warning: Are you sure you want to reboot node "mycluster-01"? {y|n}: y

Connection to xxx.xxx.xxx.xxx closed.
```

## 5.3. Execute the `kmip_post_reboot_test.sh` test script

1. Open a command window and remote login into the NetApp ONTAP Cluster Management.
2. Set diagnostics.

```
mycluster::> set diag

Warning: These diagnostic commands are for use by NetApp personnel only.
Do you want to continue? {y|n}: y

mycluster::*>
```

## 3. Enter Systemshell. Provide the password when prompted.

```
mycluster::*> systemshell -node mycluster-01
(system node systemshell)
diag@127.0.0.1's password:

Warning: The system shell provides access to low-level
diagnostic tools that can cause irreparable damage to
the system if not used properly. Use this environment
only when directed to do so by support personnel.

mycluster-01%
```

4. Execute the `kmip_post_reboot_test.sh` test script and redirect the output to file `post_reboot_output_1.txt`.

```
mycluster-01% bash kmip_post_reboot_test.sh > post_reboot_output_1.txt
Please enter key server name: KeyControl
Please enter key server version: 10.2
```

---

```
Please enter whether this is a clustered key-server config (yes or no): no
```

## 5. Exit Systemshell.

```
mycluster-01% exit
```

## 5.4. Enable FIPS mode

1. Open a command window and remote login into the NetApp ONTAP Cluster Management.
2. Set diagnostics.

```
mycluster::> set diag  
  
Warning: These diagnostic commands are for use by NetApp personnel only.  
Do you want to continue? {y|n}: y  
  
mycluster::~*>
```

## 3. Enable FIPS mode.

```
mycluster::~*> security config modify -interface SSL -is-fips-enabled true  
  
Warning: This command will enable FIPS compliance and can potentially cause some non-compliant components  
to fail.  
MetroCluster and Vserver DR require FIPS to be enabled on both sites in order to be compatible. An  
SNMP users  
or SNMP traphosts that are non-compliant to FIPS will be deleted automatically. An SNMPv1 user,  
SNMPv2c user  
or SNMPv3 user (with none or MD5 as authentication protocol or none or DES as encryption protocol  
or both) is  
non-compliant to FIPS. An SNMPv1 traphost or SNMPv3 traphost (configured with an SNMPv3 user non-  
compliant to  
FIPS) is non-compliant to FIPS.  
Do you want to continue? {y|n}: y
```

4. Reboot all nodes in the cluster. Wait 10 minutes before logging back into the cluster.

```
mycluster::~*> reboot -node *  
(system node reboot)  
  
Warning: Are you sure you want to reboot node "mycluster-01"? {y|n}: Y  
1 entry was acted on.  
  
Connection to 10.194.148.113 closed.
```

5. Log back into the NetApp ONTAP Cluster Management.

## 6. Set diagnostics.

```
mycluster::> set diag

Warning: These diagnostic commands are for use by NetApp personnel only.
Do you want to continue? {y|n}: y

mycluster::~*>
```

## 7. Verify FIPS mode is enabled.

```
mycluster::~*> security config show
Cluster      Supported
FIPS Mode    Protocols Supported Cipher Suites
-----
true        TLSv1.3,   TLS_RSA_WITH_AES_128_GCM, TLS_RSA_WITH_AES_128_GCM_8,
            TLSv1.2   TLS_RSA_WITH_AES_128_GCM_SHA256,
            TLS_RSA_WITH_AES_128_CBC_SHA,
            TLS_RSA_WITH_AES_128_CBC_SHA256, TLS_RSA_WITH_AES_256_GCM,
            ...
            TLS_SRP_SHA_DSS_WITH_AES_256_CBC_SHA,
            TLS_SRP_SHA_RSA_WITH_AES_128_CBC_SHA,
            TLS_SRP_SHA_RSA_WITH_AES_256_CBC_SHA,
            TLS_AES_128_GCM_SHA256, TLS_AES_256_GCM_SHA384
```

## 5.5. Execute the before and post test scripts a second time

1. Open a command window and remote login into the NetApp ONTAP Cluster Management.
2. Set diagnostics.

```
mycluster::> set diag

Warning: These diagnostic commands are for use by NetApp personnel only.
Do you want to continue? {y|n}: y

mycluster::~*>
```

## 3. Enter Systemshell. Provide the password when prompted.

```
mycluster::~*> systemshell -node mycluster-01
(system node systemshell)
diag@127.0.0.1's password:

Warning: The system shell provides access to low-level
diagnostic tools that can cause irreparable damage to
the system if not used properly. Use this environment
only when directed to do so by support personnel.
```

---

```
mycluster-01%
```

- Execute the `kmip_before_reboot_test.sh` test script and redirect the output to file `before_reboot_output_2.txt`.

```
mycluster-01% bash kmip_before_reboot_test.sh > before_reboot_output_2.txt
Please enter key server name: KeyControl
Please enter key server version: 10.2
Please enter whether this is a clustered key-server config (yes or no): no
Sleeping for 10 seconds before checking if aggregate was created...
Sleeping for 10 seconds before checking if vserver was created...
```

- Exit Systemshell.

```
mycluster-01% exit
```

- Reboot the node. Wait 10 minutes before logging back into the cluster.

```
mycluster::*> reboot -node mycluster-01
(system node reboot)

Warning: Are you sure you want to reboot node "mycluster-01"? {y|n}: y

Connection to xxx.xxx.xxx.xxx closed.
```

- Log back into the NetApp ONTAP Cluster Management.
- Set diagnostics.

```
mycluster:::> set diag

Warning: These diagnostic commands are for use by NetApp personnel only.
Do you want to continue? {y|n}: y

mycluster::*>
```

- Enter Systemshell. Provide the password when prompted.

```
mycluster::*> systemshell -node mycluster-01
(system node systemshell)
diag@127.0.0.1's password:

Warning: The system shell provides access to low-level
diagnostic tools that can cause irreparable damage to
the system if not used properly. Use this environment
only when directed to do so by support personnel.

mycluster-01%
```

- Execute the `kmip_post_reboot_test.sh` test script and redirect the output to file

```
p`ost_reboot_output_2.txt`.
```

```
mycluster-01% bash kmip_post_reboot_test.sh > post_reboot_output_2.txt
Please enter key server name: KeyControl
Please enter key server version: 10.2
Please enter whether this is a clustered key-server config (yes or no): no
```

11. scp the test script output files to a server of your choice. Provide the password when prompted.

```
mycluster-01% scp before_reboot_output_1.txt
root@xxx.xxx.xxx.xxx:/root/Downloads/before_reboot_output_1.txt
root@10.194.148.52's password:
before_reboot_output_1.txt                                100%  11KB  856.1KB/s
00:00
SSH terminating : scp.c : main : 690,errs = 0.

mycluster-01% scp before_reboot_output_2.txt
root@xxx.xxx.xxx.xxx:/root/Downloads/before_reboot_output_2.txt
root@10.194.148.52's password:
before_reboot_output_2.txt                                100%  11KB  10.8MB/s
00:00
SSH terminating : scp.c : main : 690,errs = 0.

mycluster-01% scp post_reboot_output_1.txt root@xxx.xxx.xxx.xxx:/root/Downloads/post_reboot_output_1.txt
root@10.194.148.52's password:
post_reboot_output_1.txt                                  100%  10KB  585.4KB/s
00:00
SSH terminating : scp.c : main : 690,errs = 0.

mycluster-01% scp post_reboot_output_2.txt root@xxx.xxx.xxx.xxx:/root/Downloads/post_reboot_output_2.txt
root@10.194.148.52's password:
post_reboot_output_2.txt                                  100%  10KB   9.6MB/s
00:00
SSH terminating : scp.c : main : 690,errs = 0.
```

12. Send these output files to NetApp for verification.

## 5.6. Verify FIPS mode is unchanged after reboot

1. Exit Systemshell.

```
mycluster-01% exit
```

2. Disable FIPS mode.

```
mycluster::*> security config modify -interface SSL -is-fips-enabled false
```

3. Reboot all nodes in the cluster.

```
mycluster::*> reboot -node *
```

---

```
(system node reboot)
```

```
Warning: Are you sure you want to reboot node "mycluster-01"? {y|n}: Y  
1 entry was acted on.
```

```
Connection to 10.194.148.113 closed.
```

4. Log back into the NetApp ONTAP Cluster Management.

5. Set diagnostics.

```
mycluster::> set diag
```

```
Warning: These diagnostic commands are for use by NetApp personnel only.  
Do you want to continue? {y|n}: y
```

```
mycluster::~*>
```

6. Verify FIPS mode is disabled on the cluster.

```
mycluster::~*> security config show
```

```
Cluster      Supported  
FIPS Mode    Protocols Supported Cipher Suites  
-----  
false        TLSv1.3,    TLS_RSA_WITH_AES_128_CCM, TLS_RSA_WITH_AES_128_CCM_8,  
             TLSv1.2    TLS_RSA_WITH_AES_128_GCM_SHA256,  
             TLS_RSA_WITH_AES_128_CBC_SHA,

             TLS_SRP_SHA_RSA_WITH_AES_128_CBC_SHA,  
             TLS_SRP_SHA_RSA_WITH_AES_256_CBC_SHA,  
             TLS_AES_128_GCM_SHA256, TLS_AES_256_GCM_SHA384,  
             TLS_CHACHA20_POLY1305_SHA256
```

## Chapter 6. Integrating with an HSM

For guidance on integrating the Entrust KeyControl with a Hardware Security Module (HSM), consult with your HSM vendor. If you are using an Entrust nShield HSM, refer to the [Entrust KeyControl nShield HSM Integration Guide](#) available at [Entrust documentation library](#).

---

# Chapter 7. Appendix A - Install a signed certificate from your local root CA in the Entrust KeyControl cluster

Any CA can be used for this integration. For the purpose of this integration, a Microsoft Windows CA configured as a local root CA was utilized.

1. [Create a CSR](#)
2. [Sign the certificate](#)
3. [Install certificate](#)

## 7.1. Create a CSR

1. Log into the Entrust KeyControl server web GUI.
2. In the **Vault Management** dashboard, select the **Settings** icon on the top right.
3. Select the **Action** icon pull-down menu. Then select **Generate CSR**.
4. Enter your information.

Include the FQDN and / or IP of all the Entrust KeyControl nodes in the **Subject Alternative Names**.

For example:

### Generate Certificate Signing Request ✕

**Common Name \***  
keycontrolvault

**Locality \***  
Sunrise

**State \***  
FL

**Subject Alternative Names \***  
kcv-10-2-node-1.interop.local,kcv-10-2-node-2.interop.local,10.241.90.241,10.241.90.241  
eg. kc-hytrust.local, 10.241.90.241,...

**Key Size \***  
4096

**Country \***  
US

**Organization \***  
[Redacted]

**Organization Unit \***  
[Redacted]

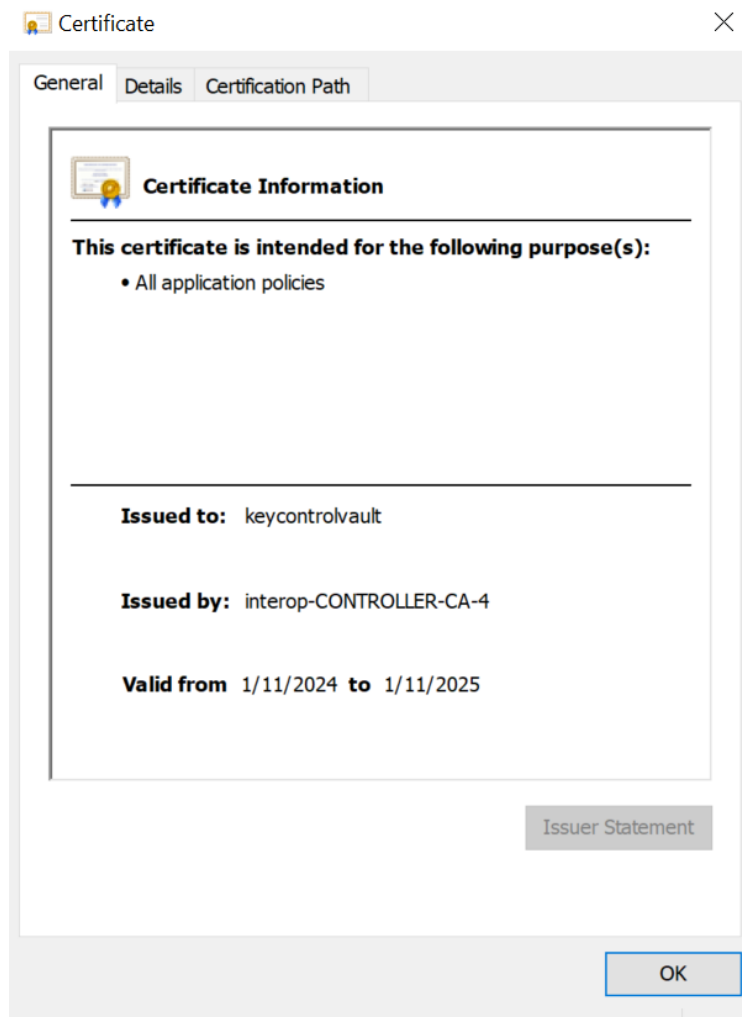

[Cancel](#) [Download](#) [Submit](#)

## 7.2. Sign the certificate

1. Log into your local root CA with Administrator privileges.
2. Copy the CSR created above to a local folder.
3. Launch the **certsvr** application.
4. Right-click on the **<certification authority name>** in the left pane and select **All Tasks / Submit new request....**
5. Select the copied CSR.

6. Select **<certification authority name> / Pending Request** in the left pane.
7. Right-click on the request in the right pane and select **All Tasks / Issue**.
8. Select **<certification authority name> / Issued Certificates** in the left pane.
9. Select the certificate.

For example:

10. Select the **Details** tab / **Copy to File...**. Follow the instructions, selecting **Base-64 encoded X.509** in **Export File Format**. Example name **keycontrolvault**.
11. Export the local root CA certificate in pem format.

```
C:\Users\Administrator>certutil -ca.cert C:\Users\Administrator\Downloads\rootcacert.cer

```

12. Copy the `keycontrolvault` certificate and the `rootcacert.pem.cer` to a location accessible by the Entrust KeyControl server.

## 7.3. Install certificate

1. Log into the Entrust KeyControl server web GUI.
2. In the **Vault Management** dashboard, select the **Settings** icon on the top right.
3. Select **Custom** radio button in **Certificate Types**.
4. Browse and select the certificate as shown.

---

**Certificate Types**  
 Default  Custom

**SSL Certificate \***  
**Browse** **Preview** keycontrolvault.cer

**CA Certificate \***  
**Browse** **Preview** rootcacert.pem.cer

Do you want to use this CA certificate to verify KMIP client certificate?  
 Yes  No

**Private Key**  
**Browse**

**Password**

**Apply** **Cancel**

5. The other defaults settings are appropriate for most applications. Make any changes necessary.
6. Select **Apply**.
